OccuScan is an affordable software option that has been designed to be operated with one module or any combination of modules all which can be accessed from one screen. That's right, one screen, four modules. Simply Simplified.

Audiometric Module — Hearing tests can be entered into the program manually or by direct audiometer transfer. Information such as date of test, time of test, employee demographics, TWA, audiometer make, examiner, etc. can be pre-filled on the test screen as a time-saving measure. OSHA items include Presbycusis (age adjusted STS calculations), 10 dB shifts per ear compared to baseline, and STS adjustment for individual ears.

Compatible Audiometers Include: Microaudiometrics - Earscan, MicroLab, Monitor - MI-5000, ETC - Autotech GRS-1C, *If your audiometer is not listed, please contact us for more information.*

Pulmonary Module — The Pulmonary module's practical features include pulmonary categories of Industry or Cotton Dust to track data and stay within the OSHA compliant boundaries. OSHA items include: Percent of Predicted (FEV1, FVC, and Ratio), changes between Pre and Post testing, and changes between baseline and all subsequent tests. Detailed questionnaire results are recorded with each test.

Medical Log Module — Medical items such as Date of Visit, Type of visit, Blood Pressure, Temperature, Pulse, Respiration, Assessment, Action Plan, Drug Screen Results, EKG results, Hematology (type, data, results), Medications, Pain Scale, etc.

Drug Screening Module — The Drug Screening Functions Module include information such as purpose of test, collection date, specimen temperature as well as results from ethyl alcohol, amphetamines, barbiturates, benzodiazepines, cocaine, opiates/morphine, PCP, marijuana, methadone, methamphetamines, etc. Random list function included.

Works with Windows 95, 98, 2000, NT, ME, XP, Vista,

The image displays three overlapping screenshots of the OccuScan software interface. The top screenshot shows the main dashboard with the OccuScan logo and navigation tabs for Audiometry Tests, Pulmonary Tests, Medical Log Visits, Drug Screening Entries, and Reports. It indicates the user is working with client 'rudytest' and is currently active in the 'Employee Demographics' module. A form for entering employee information is visible, including fields for Social Security No., Company, Last Name, First Name, Sex, Race, Height, Weight, Birth Date, and Date Hired.

The middle screenshot shows the 'Audiometry Tests' module. It features a table for recording test results with columns for Date, Time, Sft, Department, Work Area, Hearing Protection, and Examiner. The table shows data for a test on 1/1/2001 at 2 Sft in the PLUGS department, performed by examiner CF. Below the table are sections for 'Left' and 'Right' ear results, each with a dropdown for 'B' and a grid of frequency response values (10, 10, 10, 10, 10, 10, 10) and a 'Comments' field.

The bottom screenshot shows the 'Pulmonary Tests' module, specifically a 'COUGH' questionnaire. It includes a table for recording cough symptoms (COUGH, PHLEGM, CHEST, TIGHTNESS, BREATH, ILLNESS, SMOKE) and a series of questions (Cough31-Cough35) with 'Y/N' response options. The questions relate to cough frequency, timing, and duration.
